

## SWITCH PANELS

Switch panel producers who know about greenhouse cultivation

# Switch panel producers who know about greenhouse cultivation

PB tec has a separate division that focuses exclusively on constructing switch panels for horticultural and industrial projects. Some are standard designed, though mostly the panels are produced for specific projects, allowing for a compact and easy setup on location.

## SWITCH PANELS

PB tec's switch panels are developed and produced in-house. The result is an integrated product that is customised to suit the entire system, allowing the installer to work with an understandable assembly package. Malfunctions are kept to a minimum, in part because of the high-quality components and the compact nature of the package.

### Installation anywhere in the world

The Switch Panels division employs a large number of skilled and specially trained mechanics, with special tools and separate testing areas. All switch panels are initially constructed to comply with prevailing Dutch standards. Essentially all systems can be customised to match local conditions and requirements anywhere in the world. PB tec supplies the switch panels with instruction diagrams and connection data, integrated onto a screen. This makes connecting the switch panels a simple matter, and as a consequence saves you a lot of money.

### Integration

As the Switch Panels division is part of the PB tec organisation, it is easy to coordinate construction with the Computer division. Sometimes this results in a unique team effort, with entire computers being incorporated into the switch panel. This helps keep the number of connections to a minimum, which in turn serves to minimise malfunctions in the system as a whole. On location, the mechanic can hook such a combination up directly to the grid, as a complete assembly package. Our specialists are ready and waiting!
